Credit Name: CS20
Assignment Name: Chapter 5 Mastery Reflection Log

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge? I read the prompt and used the textbook examples to see exactly how the loop math needed to work.

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion? Separating digits mathematically was tricky, but checking class notes on the modulo operator (%) helped me figure it out.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding? Yes, i first made my codes on docs then put them into eclipse.

How did you decide on the tools, data structures, or algorithms to use? I didn't know the exact number of cycles beforehand, so a while loop was the best tool.

Implementation

Did you write the code in small pieces or attempt the entire solution at once? In pieces. I got the console user inputs working first before adding the loop logic.

How did you test your solution along the way to make sure it was working? I plugged in the textbook example values (like 892) to see if the math outputs matched.

Overcoming Challenges

What part of the problem was the most difficult for you? Fixing an infinite loop error in my investment code that kept crashing it.

How did you handle moments when you felt stuck or unsure of what to do next? I stopped coding and traced the variables on paper to see where the logic was breaking.

Learning

Was there anything you learned that you think will help you with future challenges? I learned how to use % 10 and / 10 to easily pull apart numbers in Java.
